Macroecology and conservation in a changing world

Why do the number and identity of species vary across space? In this MSc project, you will analyze species distributions using biodiversity databases such as GBIF. You can take a theoretical approach, exploring how species' ability to reach new areas, environmental conditions, and random events shape where they occur. Alternatively, you can focus on conservation, exploring how urbanization, climate change, and land use affect biodiversity. The organism groups (e.g., birds, plants) and study area can be tailored to your interests.

Do not hesitate in contacting if you have your own ideas.
